AUTHOR: Shirokhov, M. F.

TITLE: The Application of the Functions of the Decompositions to the Theory of Semiordered Spaces

PERIODICAL: Vestnik Leningradskogo universiteta, Seriya matematiki, mekhaniki i astronomii, 1960, Vol.19, No.4, pp.29-36

TEXT: The author uses notions and notations from (Ref.1) of L. V. Kantorovich, B. Z. Vulikh and A. G. Pinsker and proposes a new direct method for defining the continuous functions fo a decomposition (the method renders possible a generalization to certain discontinuous functions.)

Let $\mathcal{E}$ be a complete Boolean algebra, $e \in \mathcal{E}$. Let $\Omega(e)$ be the set of all decompositions $\omega(\lambda)$ of e. Let Ω be the set of all decompositions $\omega(\lambda)$ at all. It is put $\omega_1 \leq \omega_2$, $\omega_1, \omega_2 \in \Omega(e)$, if from $\lambda < \mu$ it follows $\omega_1(\mu) \geq \omega_2(\lambda)$. ω_1 and ω_2 are called equivalent, if $\omega_1 \leq \omega_2$ and $\omega_2 \leq \omega_1$ holds simultaneously.

Theorem 1. $\Omega(e)$ is a complete structure (proof in (Ref.1)).

Definition 2: Let $F(u,v)$ be a real continuous function defined in the whole plane, $\omega_1, \omega_2 \in \Omega$. Let the decomposition

The Application of the Functions of the Decompositions to the
Theory of Semiordered Spaces

$\omega_3 = F(\omega_1, \omega_2)$ be defined by $\omega_3(\lambda) = \text{l.u.b.} \{ [\omega_1(b) - \omega_1(a)]$
$\wedge [\omega_2(d) - \omega_2(c)] \}$, where l.u.b. is carried out over all
segments $[a, b; c, d]$ for which it is

$[a, b; c, d] \subset \underset{(u,v)}{\mathcal{E}} (F(u,v) < \lambda)$

Theorem 2: 1.) Definition 2 gives a decomposition, i. e.
$\omega_3 = F(\omega_1, \omega_2)$ satisfies the usual definition (Ref.1).

Theorem 3: Let $F(u,v)$ and $\phi(u,v)$ be real continuous functions
defined in the whole plane. Then: 1.) If $F(u,v) = \phi(u,v)$ every-
where except the set E which has zero weight relative to the
decompositions ω_1, ω_2, then it is $F(\omega_1, \omega_2) = \phi(\omega_1, \omega_2)$;

2.) if $F(\omega_1, \omega_2) = \phi(\omega_1, \omega_2)$, then it is $F(u,v) = \phi(u,v)$
everywhere except the set E which has zero weight relative to
ω_1 and ω_2.

C 111/ C 333

The Application of the Functions of the Decompositions to the
Theory of Semiordered Spaces

Theorem 4: Let $F_{1k}(u,v)$, $F_{2k}(u,v)$ $(k = 1,2, \ldots , m)$, $\phi_1(u,v)$, $\phi_2(u.v)$ be real, continuous, defined in the whole plane. If from $F_{1k}(u,v) = F_{2k}(u,v)$ $(k = 1,2,\ldots,m)$ it follows that $\phi_1(u,v) = \phi_2(u,v)$, where u, v are real numbers, then from $F_{1k}(\omega_1,\omega_2) = F_{2k}(\omega_1,\omega_2)$ $(k = 1,2,\ldots,m)$ it follows that $\phi_1(\omega_1,\omega_2) = \phi_2(\omega_1,\omega_2)$.

Theorem 5: The set Ω of the partitions of the unit of the algebra with introduced partial order and linearization is a K-space. (Proof see (Ref.1)).

Theorem 6: The K-space Ω of the partitions of the unit of the algebra contains the unit and its basis is isomorphic to the initial Boolean algebra (proof see (Ref.1)).

Let X be a K-space with unit, $\mathcal{E}(X)$ - its basis - a complete Boolean algebra. $\Omega(X)$ = K the space of the partitions of the unit of $\mathcal{E}(X)$. To every $x \in X$ there corresponds its characteristic

Theory of Semiordered Spaces

$\omega \in \Omega(X)$, where $\omega(\lambda) = e_\lambda^x$ The subset of $\hat{\Omega}(X)$ consisting
of all characteristics is called Ω' .

Theorem 7: Every K-space with unit is isomorphic to the normal
subspace $\Omega' \subset \Omega(X)$, where Ω' is complete in $\Omega(X)$.

TITLE   Technical Quality Control With Gamma Rays From Radioactive Cobalt Co^{60} (Tekhnicheskiy kontrol' gamma-luchami radio-aktivnogo kobal'ta Co^{60})

PERIODICAL: Sb. nauchn. tr. Tashkentsk. in-t inzh. zh.-d. transp., 1957. Nr 7, pp 131-142

ABSTRACT   Described are γ-ray emitters, apparatus for flaw detection with γ-rays, methods for plotting gamma-diagrams, and the sensitivity of the method of flaw detection with γ-rays. The method is developed for the utilization of the GUP-Co-0.5-1 installation for γ-ray examination of steel 10-170 mm thick. For small thicknesses of steel ($\sim$ 10 mm) it is considered feasible to use Co^{60} provided that the focal distance is increased to 40-50 cm and that Pb electrons [electrodes? Transl. Note] are used. 1. Steel--Inspection 2. Gamma rays--Applications 3. Gamma ray analysis--Equipment 4. Cobalt isotopes T.R. (Radioactive)--Performance

Alterations in the excitability of the motor nerve under the influence of the electrolytes potassium, calcium, magnesium and sodium. V. E. Shukhgol'ts and I. I. Kalikin.

Hypertonic solns. of KCl, MgCl₂, NaCl and CaCl₂, when applied to the rheoscopic nerve of frogs, cause an excitation of the nerve after variable periods of time, resulting in muscular contraction.

PROCESSES AND PROPERTIES INDEX

A new method for the simultaneous feeding and observation of the isolated heart in situ and the importance of the method for the investigation of the problem of chemical coördination. V. P. Shirokii. J. Physiol. (U. S. S. R.) 77, 372 8(in English, 378)(1939).—For the investigation of the problem of chem. coördination the arteries and veins of a donor dog are joined to the heart-lung prepn. from another dog. Fibrillation is relieved by the injection of 0.5% KCl and 1% NaCl soln. into the coronary vessels of the isolated heart until fibrillation is stopped, followed by a mixt. of 1% CaCl₂ and 1% NaCl until the nomotopic rhythm is restored. A neg. ino- and chronotropic response to K ion and a pos. response to Ca ion are given by the isolated heart when the donor dog is injected with these electrolytes under morphine and CHCl₃ anesthesia. The heart of the donor shows a slowing of the heart beat and a rise in blood pressure. The injection of Mg and Na causes an acceleration of cardiac rhythm and fall in blood pressure in the donor dog with slowing of the rate and weakened systolic contractions of the isolated heart. The injection of adrenaline into the donor results in a lowering of the heart rate in the donor and an acceleration of the rhythm in the isolated heart. The denervated isolated heart is more susceptible to CHCl₃ than the normally innervated heart of the donor.

The vegetative cutaneous reflexes and the effect of electrolytes. V. F. Shirokii. *J. Physiol. U. S. S. R.* 29, 165-73(in English, 172)(1940).—Intracutaneous injection of NaCl, KCl, CaCl₂ and MgCl₂ in isotonic or hypertonic solns. affects the vegetative nerves of the heart and the nictitating membrane of cats, as shown by alteration of excitability of the peripheral end of the cardiac vagus under action of induction current. The tonus of the sympathetic nervous system is augmented by all the above electrolytes in the isotonic concns. In addn. 0.85% NaCl soln. simultaneously increases the tonus of the parasympathetic nervous system in practically all cases. An isotonic (1%) KCl soln. increases the tonus of the latter in 70% of the cases, a 2.8% CaCl₂ soln. in 30% of the cases, and a 2.8% MgCl₂ soln. in only a few cases. In the remaining cases Mg and Ca ions lower the tonus of the parasympathetic system, while increasing that of the sympathetic nerves. Hypertonic solns. of NaCl and KCl give only a weak (5%) or transitory (10%) increase of the sympathetic nerve-tonus, accompanied by a lowering of the tonus of the parasympathetic system. The narcotic used and the species of the animal affect the results. The specificity of the electrolyte action was demonstrated by addnl. expts. with Ringer soln. 8 references.   C. S. Shapiro

Širokorad, B. V. On the applicability of the central limit theorem to Markov chains. Izvestiya Akad. Nauk SSSR. Ser. Mat. 18, 95–104 (1954). (Russian)

Let s_n be the sum of the first n variables of a Markov chain with the two states 0, 1 and mth transition matrix $[_m p_{ij}]$, where $_m p_{10} \sim a m^{-\alpha}$, $_m p_{01} \sim b m^{-\beta}$, $0 < \alpha \leq \beta \leq 1$. The following theorems are proved. (1) If $\beta < 1$, then $[s_n - E\{s_n\}]/(\text{st. dev. } s_n)$ is asymptotically normal, with mean 0 and variance 1. (2) If $\alpha < \beta = 1$, then s_n/n^α has asymptotically the distribution with density const. $\times t^{(b/a)-1} e^{-at}$, for $t \geq 0$. (3) If $\alpha = \beta = 1$, then s_n/n has asymptotically the distribution with density const. $\times t^{b-1}(1-t)^{a-1}$, for $0 \leq t \leq 1$.

AUTHOR: Shirokorad, B. V. (Moscow)   SOV/105-19-10-5/12

TITLE: On the Existence of a Cycle Beyond the Conditions for the
             Absolute Stability of a Three-Dimensional System (O sushchest-
             vovanii tsikla vne usloviy absolyutnoy ustoychivosti trekh-
             mernoy sistemy)

PERIODICAL: Avtomatika i telemekhanika, 1958, Vol 19, Nr 1o, pp 953-967
             (USSR)

ABSTRACT: This is an investigation of some properties of the phase char-
             acteristics of a basic system of automatic control (Ref 2)
             which is specified by equations (1). The ingenious feature
             of the problem raised in this paper is that the investigation
             of the phase characteristics is conducted beyond the neces-
             sary and sufficient conditions (as conceived by Lur'ye-
             Letov, Ref 1), excluding the bifurcation case at the boundary
             (Ref 16). The analytical investigation is preceded by two
             physical interpretations: 1) An automatically controlled
             system (Ref 2) consisting of an aircraft and a stabilizer,
             the controlled variable being the angle of bank γ. 2) The
             classic diagram of a univalve electronic generator (Ref 11).
Card 1/2   The existence of a non-trivial (in the special case of a

SOV/103-19-10-5/12

On the Existence of a Cycle Beyond the Conditions for the Absolute Stability
of a Three-Dimensional System

periodic) stabilized operation schedule beyond the conditions
for absolute stability (as conceived by Lur'ye - Letov, Ref 1)
is proved. These conditions hold for a self-operated system
with the neutral object and a controller with a non-linear
rate of setting the final element. Although this method was
derived from the investigation of the phase characteristics
of three-capacity systems of automatic control with a non-
linear final element, the results can be generalized to
three-capacity and multi-capacity systems incorporating non-
linearities of different kind. The relations advanced in
this paper make possible an estimation of the limits of the
tuning-in of the transfer-conditions of the automatic system
and of the amplitudes of possible oscillations in practical
cases. The remarks stemming from B. N. Petrov, V. V. Nemytskiy,
E. M. Vaysbord and Yu. P. Portnov-Sokolov were taken account
of in this paper. There are 9 figures and 24 references, 18
of which are Soviet.

TITLE: On the Almost-Periodic Regime of a Four-Dimensional Automatic Control System

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh nauk, Energetika i avtomatika, 1960, No.5, pp.159-165

TEXT: Paper presented at the V.V.Nemitskiy Seminar (qualitative theory of differential equations) at Moscow State University, February 22, 1959 and partly at the 1st All-Union Meeting of Mechanics Specialists, February 1, 1960.
In the design of multi-dimensional control systems with $n \geqslant 3$ the basic concepts of automatic-control theory, the starting, transient steady-state and other complex regimes are difficult to define. The article constitutes an attempt to define these concepts using the Perron theorem (Ref.6) and the concept of canonic control system. The basic method of the article is topological composition. It is claimed that the theory developed here permits finding the starting characteristics of multi-dimensional interacting control systems with many non-linearities.

TITLE: Steady Performance of Automatic Control Systems

PERIODICAL: Avtomatika i telemekhanika, 1960, Vol. 21, No. 4, pp. 456-464

TEXT: This is the reproduction of a lecture delivered on January 29, 1960 at the First All-Union Conference on Mechanics. - The author first states that the characteristics of independent automatic control systems can be described by a set of ordinary differential equations as, e.g., by equation (1) in Cauchy form. According to A. M. Lyapunov (Ref. 2), every unperturbed solution of (1) is steady with regard to its initial perturbations. The determination of steady states is of special importance in the study of automatic control systems. Some earlier publications on this subject are mentioned (K. F. Teodorchik, V. V. Nemytskiy, A. A. Andronov, and M. A. Ayzerman). The author makes use of the topological dynamics for determining the characteristics of a dynamic system. Thus, conditions for a periodic performance of the systems are established. Publications by A. A. Markoff (Ref. 13) are mentioned in this connection.

TITLE: On the nearly periodic motion regime of gyroscopic guiding apparatus

SOURCE: Moscow. Universitet druzhby narodov. Trudy, v. 10, 1965. Matematika, no. 1, 23-31.

TOPIC TAGS: gyroscope, control equipment, control circuit, control jet, pneumatic control, servomechanism system

ABSTRACT: An automatic guiding apparatus is described for observing celestial bodies. The distributing system of the apparatus consists of an electromagnet with a constant current magnetization winding and an armature on which a nozzle is mounted. The armature rotates on its axis under a ponderomotive force according to the law

$$T_\rho \dot{\alpha}_\rho + \alpha_\rho = k_\rho \alpha.$$

The equations governing the state of the gas in the instrument cavity are given, and for $T_p = 0$ the following power equation is obtained for the distributing instrument

$$\lambda = k_\alpha \alpha - k_y \dot{y} - f(\lambda),$$

where λ is the resultant pressure of the compressed air on the piston. The equations of motion for the external frame of the apparatus are

Card 1/2

ACC NR: AT7000582

$$\left.\begin{array}{c} J_1\dot{v} + M_1 v + \dot{\alpha} + l_1\lambda = 0 \\ -v - i_1\ddot{\alpha} + m_1\dot{\alpha} = 0 \\ \lambda = k_a\alpha + k_v v - f(\lambda) \end{array}\right\}$$

where

$$J_1 = k_v J/H_1, \quad M_1 = k_v M/H_1, \quad i_1 = i/H_1 k_v, \quad m_1 = m/H_1 k_v, \quad l_1 = l_0/H_1 ,$$

assuming that the angle of rotation of the internal frame B is zero relative to the external universal joint of the antenna. It is shown that there exists an almost periodic regime with two mutually independent frequencies, one of which is close to the nutation frequency and the other is proportional to the angle B. Orig. art. has: 14 equations and 1 figure.

TITLE: At the 4th Plenum of Trade-Union Central Committee

PERIODICAL: Energetik, 1959, Nr. 10, pp 34-35, (USSR)

ABSTRACT: In August, 1959, the 4th Plenum of the Central Committee
               of the trade-union of workers of electric power stations
               and electrical industry took place. At the Plenum, two
               questions were discussed: "On Results of the June Plenum
               of the Central Committee of the Communist Party of the
               Soviet Union, and on the Problems of Professional Organ-
               izations", and on the decision of the VTsSPS Presidium
               "On the Work of the Central Committee of the Trade-Union
               of Workers of Electric Power Stations and Electrical In-
               dustry." A number of persons appeared at the Plenum:
               President of the State Committee on Radio-Electronics
               attached to the Council of Ministers of the USSR, V.D.
               Kalmykov, noted that leading role in the development of
               industrial progress belongs to radio-electronics. Over
               the last 7 years, the general increase in Soviet indus-
Card 1/5   try amounted to 80%; production volume in machine-buil-

SOV/91-59-10 23/29

At the 4th Plenum of Trade Union Central Committee

ding increased 2 times, and in electrical industry - 3
times. Production in the field of electronics will deve-
lop at a still higher rate; its volume will be increased
within the next 7 years more than 3.5 times. In 1965, 3.5
million television receivers will be produced, and over
7 million radio-sets. By that time, there will be more
than 150 television centers in the country, so that 85%
of the Soviet Union population will enjoy television. The
first Deputy Assistant of the Minister of Building of E-
lectric Power Stations, P.S. Neporozhniy, stated that the
Ministry has developed a number of projects how to double
and treble, within the next few years, production of ener-
getic installations and to create the high-voltage net-
works which would ensure total electrification of the
country. The Cief of Direction of the State Committee on
Automation and Machine-Building at the Council of Minis-
ters of the USSR, N.I. Borisenko, stated: "Although our
rate of development in the sphere of electro-technics
and instrumet building is more rapid than in other bran-
Card 2/5   ches of machine-building, it is still insufficient".

SOV/91-59-10-23/29

At the 4th Plenum of Trade Union Central Committee

Special emphasis is to be laid upon decreasing manual labor which in the electrical industry still amounts to 60%. Deputy Assistant of the President of the Central Board of Administration of the Scientific-Technical Society of the Energetics Industry, A.P. Pavlushkov, reported on the task carried out by the organization NTO in compliance with decisions passed at the June Plenum of the Central Committee of the Communist Party of the USSR. So, for instance, the Murmansk Administration Board had developed and realized 11 projects for mechanization of electro-transmission repair works, 27 projects for automation and telesignalization of GES, substations, communication channels, etc. He criticized the Gosplan which delays the examination of proposals submitted by the Scientific-Technical Society and concerning the rapid development of the electro-technical industry. The Secretary of the Kemerovskaya Oblast Trade-Union Committee, Palkin, reported on the high activity of workers' gatherings in discussing the Plenum decisions and working out practical measures for their

Card 3/5

SOV/91-59-10-23/29

At the 4th Plenum of Trade Union Central Committee

realization. The woman-worker in the nickeling depart-
ment of the Kursk Electrical Appliances Plant, Drobyshe-
va, called the attention of the Gosplan USSR and Gosplan
RSFSR to unsatisfactory planning of material funds. The
Chairman of the Stalino Trade-Union Obkom, Prudkiy, told
about the exchange of experience between individual en-
terprises. A talk on the second question was given by
Chairman of the Central Committee of the Trade-Union of
Workers of the Electric Power Stations and Electrical
Industry, M.Ya. Aleksandrov. He reported on shortcomings
in the work of the Trade-Union Committee that were dis-
closed by decision of the VTsSPS Presidium on July 3,
1959, and on the measures outlined to eliminate them.
Chairman of the Saratov Trade-Union Obkom, Ivanov. In-
structor for Teaching Advanced Methods of Work (City:
Gor'kiy), Denisov noted the rightness of decisions pass-
ed by the Presidium of the VTsSPS. In conclusion, Secre-
tary of the VTsSPS, A.A. Bulgakov, sharply criticized
the activity of the Trade-Union Central Committee: The
Card 4/5   work on realization of plans worked out by the 21st Par-

SOV/91-59-10-23/29

At the 4th Plenum of Trade Union Central Committee

        ty Congress and by the 12th Trade-Union Congress is not
        being carried out in the proper way; there is not enough
        control over implementing collective agreements; labor
        protection and safety measures are not adequate; the
        leaders of trade-union committees commit serious errors
        in their work. The Plenum of the Trade-Union Central
        Committee admitted its mistakes and will take measures
        to eliminate them in the future.

A new method of studying...

reversal of the ferroelectric. The authors studied BaTiO$_3$ single crystals
and Seignette salts. For BaTiO$_3$ the change of ϵ is due to the orientation
of the domains and to the difference in permittivity along and perpendicular
to the direction of polarization. In all BaTiO$_3$ crystals the leading edges
of the input and output pulses were shifted by less than 0.1 μsec, in
contrast with the results obtained by W. Merz (J. Phys. Rev., 95,
690-698, 1954; J. Appl. Phys. 27, 938-943, 1956). This divergence is
probably due to the smaller dimensions of the specimens (0.5·0.5·0.5 mm^3)
and to the different mechanical deformation, but definite explanations
would need to be based on more exact experiments. Unlike what happens in
barium titanates, output pulse amplitude oscillations occurred in Seignette
salts at a frequency exactly corresponding to the mechanical natural
vibration. This new method does not make it possible to observe pole
reversal of materials whose spontaneous polarization has only two
orientations, but it offers the advantage over all ordinary methods that
the beginning of pole reversal can be observed. There are 4 figures.

TITLE: The characteristics of the amplitude dependence of internal
friction in single-crystal ferroelectrics

ABSTRACT: An experimental study has been made of some features of
the internal friction in single crystals of Rochelle salt and tri-
glycin sulfate with various types of the Weiss domain structure.
The bar-shaped samples, measuring about 30x4x2 mm, were tested in a
constant-temperature retort. As it was very difficult to measure
the deformation amplitude of the samples, the experimental curves
were plotted according to the current passed through the crystal by

Card 1/2

ACCESSION NR: AP4016505

mechanical resonance oscillations. The behavior of the logarithmic damping decrement was studied while the current going through the sample was changed from 0.02 to 2 milliamperes. The results of the above tests justify the following two basic conclusions: 1) the intensive internal friction in some of the Rochelle salt samples within the ferroelectric temperature region is determined by a variety of Weiss domain processes. It is possible that large deformation amplitudes produce volumetric deformations which change the nature of the internal friction. 2) It may be assumed that the amplitude dependence of the internal friction in the case of relatively small deformations will be observed in the ferroelectric region of the Rochelle salt crystals in which the reorientation of the Weiss domains may occur under the effect of homogeneous mechanical stresses. Orig. art. has: 2 figures.

TOPIC TAGS: electronic equipment, reliability engineering, reliabi-
  lity·theory, system reliability

PURPOSE AND COVERAGE: This book is intended for scientific and
  technical personnel concerned with the design and use of electronic
  equipment, and can also be used by students in advanced courses at
  radio-engineering schools of higher education. The basic problems
  involved in the use of electronic equipment are reviewed. Much
  attention is paid to reliability, preventive maintenance and the
  reconditioning of equipment. Methods of experimentally studying
  reliability are discussed, and methods for evaluating equipment
  effectiveness are proposed.

TITLE: Favorable Conditions for Induction-hardening of Various
Parts of Equipment (Ratsional'nyye rezhimy induktsionnoy
zakalki detaley oborudovaniya)

PERIODICAL: Stal', 1958, Nr 8, pp 730 - 736 (USSR)

ABSTRACT: Optimum conditions for hardening with high-frequency
currents on an installation with a rotary generator of
100 kW (2 500 cps) of rolls of various diameters, tooth
wheels, crane wheels, and brake pulleys were investigated.
The results are given in tables and figures. It is con-
cluded that by using the above equipment for hardening a
depth of the active layer of 2 - 4 mm can be obtained.
The total depth of the hardened layer of up to 10 mm can
be obtained. Application of high-frequency hardening
brought about an increase in the service life of machine
parts, on the average, by 2-3 times.
There are 11 figures, 3 tables and 3 Soviet references.

Sirokov, A. P. On the problem of A-spaces. Sto dvadcat' pyat' let neevklidovoĭ geometrii Lobačevskogo, 1826–1951 [One hundred and twenty-five years of the non-Euclidean geometry of Lobačevskiĭ, 1826–1951], pp. 195–200. Gosudarstv. Izdat. Tehn.-Teor. Lit., Moscow-Leningrad, 1952. 7.60 rubles.

In an affine vector space of $2n$-dimensions we can associate two n-vectors $V^{i_1\cdots i_n}$ and $V_{i_1\cdots i_n}$ by means of the equations

$$n!\,V^{i_1\cdots i_n} = \epsilon^{i_1\cdots i_n a_1\cdots a_n} V_{a_1\cdots a_n},$$
$$n!\,V_{i_1\cdots i_n} = \epsilon_{a_1\cdots a_n i_1\cdots i_n} V^{a_1\cdots a_n}$$

when the ϵ are $2n$-vectors for which $\epsilon^{i_1\cdots i_n}\epsilon_{k_1\cdots k_{2n}} = \delta^{i_1\cdots i_n}_{k_1\cdots k_{2n}}$. In the projective P_{2n-1} of the pseudo-vectors two n-vectors V and W which have no vectors in common, determine two non-intersecting $(n-1)$-spaces and with it a point involution. To this involution belongs the tensor

$$g_i{}^j = V^{i a_1\cdots a_n} W_{j a_1\cdots a_n} - (-1)^n W^{i a_1\cdots a_n} V_{j a_1\cdots a_n}.$$

For $n=2$ we have the biaxial case of Norden [see the preceding review].

If we now take the A_{2n} with symmetrical affine connection $(\Gamma^\alpha_{\beta\gamma})$ in which two simple n-vectors V and W are given for which

$$\nabla_\alpha V^{\gamma_1\cdots\gamma_n} = \lambda_\alpha V^{\gamma_1\cdots\gamma_n}, \quad \nabla_\alpha W^{\gamma_1\cdots\gamma_n} = \mu_\alpha W^{\gamma_1\cdots\gamma_n},$$

then the n-spaces of V and W form two families of n-dimensional surfaces. Then $\nabla_\alpha g_\beta{}^\gamma = 0$. Two cases are now discussed; in the first case V and W are real, in the second V and W are complex conjugate. In the first case we can introduce a special set of n coordinate lines on the surfaces V and n coordinate lines on the surfaces W such that ...

(over)

new coordinates $x^1 \cdots x^n$, $x^{n+1} \ldots x^{2n}$

$$\partial_k g_{r, n+s} - \partial_r g_{k, n+s} = 0, \quad \partial_{n+k} g_{r, n+s} - \partial_{n+s} g_{r, n+k} = 0,$$
$$k, r = 1, \cdots, n,$$

is the condition that the tensor $s_{\alpha\beta}$ is covariant constant. Here the tensor $s_{\alpha\beta}$ has the property that $a_{\alpha\beta} = g_{\alpha}{}^{\epsilon} s_{\epsilon\beta}$ is anti-symmetric, $a_{\alpha\epsilon} a_{\beta}{}^{\epsilon} = -s_{\alpha\beta}$.

These spaces are related to the stratified spaces of Raševskiĭ [see the paper reviewed below]. By taking $x^{i'} = x^i + x^{n+i}$, $x^{n+i'} = x^i - x^{n+i}$ we can associate to every point x^{α} (the ''s are omitted) and vector v^{α} a point X^k and vector V^k of an n-dimensional dual space

$$X^k = x^k + e x^{n+k}, \quad V^k = v^k + e v^{n+k}, \quad e^2 = +1,$$

with a connection $\Gamma_{ij}^k = \Gamma_{ij}^k + e \Gamma_{n+i, n+j}^k$. This space is a dual unitary space with metrical tensor

$$A_{k\bar{r}} = s_{kr} + e a_{kr} = s_{kr} + e s_{n+k, r},$$

and no torsion.

In the second case, by a new choice of coordinates x^{α} and taking

$$X^k = x^k + i x^{n+k}, \quad V^k = v^k + i v^{n+k}, \quad {}'\Gamma_{ij}^k = \Gamma_{ij}^k - i \Gamma_{n+i, n+j}^k$$

we obtain a unitary space of Schouten with a hermitian metrical tensor $A_{k\bar{r}} = s_{kr} - i a_{kr}$. The tensor $s_{\alpha\beta}$ is covariant constant if

$$\partial_{[j} s_{m]k} - \partial_{[n+j} s_{n+m]k} = 0, \quad \partial_{[j} s_{n+m]k} + \partial_{[n+j} s_{m]k} = 0,$$

which points to the absence of torsion.

The relation between stratifiable and unitary spaces without torsion was pointed out by B. A. Rozenfeld [Trudy Sem. Vektor. Tenzor. Analizu 7, 260–275 (1949); these Rev. 12, 359]. It is stressed that the whole theory dates back in principle to the theory of A-spaces given by P. A. Širokov [Bull. Soc. Phys.-Math. Kazan (2) 25, 86–114 (1925)].

D. J. Struik (Cambridge, Mass.).

USSR/ Mathematics - Affine transformations

Card 1/1   Pub. 22 - 11/62

Authors   : Shirokov, A. P.

Title   : About the characteristics of covariantly stable "affinors" (affine trans-
               formation "operators", Transl. note)

Periodical   : Dok. AN SSSR 102/3, 461 - 464, May 21, 1955

Abstract   : A proof is given that is is possible to construct such a holonomous sys-
               tem of coordinates in which the coordinates of a covariant stable "affi-
               nor" are constant (in particular, in which the matrix of an affinor, for
               the total space, reduces to the canonical Jordan form). However, only
               eigenvalued real numbers are considered. Diagrams.

Institution : V. I. Lenin-Ul'yanov State University, Kazan'

Presented by: Academician A. N. Kolmogorov, January 18, 1955

16(1)   PHASE I BOOK EXPLOITATION   SOV/2651

Shirokov, Petr Alekseyevich (Deceased), and Aleksandr Petrovich Shirokov

Affinnaya differentsial'naya geometriya (Affine Differential Geometry)
Moscow, Fizmatgiz, 1959. 319 p. 6,000 copies printed.

Ed. (Title page): A.P. Norden; Ed. (Inside book): A.F. Lapko; Tech. Ed.:
Ye. A. Yermakova.

PURPOSE: This book is intended for students, aspirants, and scientific workers
specializing in geometry.

COVERAGE: The book was produced by A.P. Shirokov on the basis of notes left
by P.A. Shirokov which contained a detailed outline of a course of lectures
on affine differential geometry. For the most part, the book consists of a
discussion of the differential geometry of a 3-dimensional centroaffine and
equiaffine space. However, certain aspects of the theory of surfaces are also
discussed and applied directly to the n-dimensional case. The method by which
this is done is given in the Appendix written by A.P. Norden. Among the
topics treated are: theory of plane curves, space curves, centroaffine theory
of surfaces, theory of surfaces in the geometry of an equiaffine group,

Affine Differential Geometry   SOV/2651

special classes of surfaces, ruled surfaces, relative theory of surfaces,
and congruences of straight lines in equiaffine space. The author thanks
A.P. Norden for help in producing the book. There are 401 references:
78 Russian, 184 German, 64 French, 54 English, 19 Italian, 1 Rumanian,
and 1 Czech.
